

Worksheet — The Inflorescence

Student Name: _____ Date: _____

Section: _____ Class/Roll No: _____

A. Fill in the Blanks

1. A flower is a modified and condensed _____.
2. In racemose inflorescence, flowers follow _____ succession.
3. In cymose inflorescence, flowers follow _____ succession.
4. The main axis in cymose inflorescence _____ in a flower.

B. One Word Answer

1. Name the type of inflorescence where the main axis continues to grow. Ans: _____
2. Name the type of inflorescence where the main axis terminates in a flower. Ans: _____
3. Name the meristem that transforms to form a flower. Ans: _____
4. Name the type of flower formed when the shoot tip fully transforms. Ans: _____

C. Match the Following

Column A	Column B
Racemose	Acropetal
Cymose	Basipetal
Solitary flower	Single flower
Floral meristem	Transformed apex

D. True or False

1. Internodes elongate during floral transition. (True/False)
2. Racemose inflorescence shows acropetal succession. (True/False)
3. Cymose inflorescence shows acropetal succession. (True/False)
4. A solitary flower results from complete transformation of the shoot tip. (True/False)

E. Short Answer Questions

1. Differentiate between racemose and cymose inflorescence. **[2 Marks]**
2. What is meant by acropetal succession? **[2 Marks]**

F. Short Essay Questions

1. Explain why a flower is considered a modified shoot. **[3 Marks]**
2. Describe the growth pattern differences between racemose and cymose types. **[3 Marks]**

G. Long Answer / Essay Questions

1. Discuss the process of transformation of a shoot apical meristem into a floral meristem, and explain the two main types of inflorescence with examples. **[5 Marks]**
